## Abstract

Establishing new relationships between the physical properties and the molecular structure of chemical compounds is very exciting. In this short paper, a QSPR analysis is carried for physical properties of lower alkanes involving Peripheral Wiener index, number of paths of length 3 and the number of vertices in molecular graphs and best multiple linear regression models are presented for boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures, critical pressures and surface tensions of lower alkanes.

**Keywords:** Topological index, Peripheral Wiener index

2010 MSC: 05C12

## 1. Introduction

The text-book of Harary [2] has been referred for basic definitions and notions in graph theory. The non-standard notions will be given in this paper as and when required.

Let  $G = (V, E)$  be a graph (finite, simple, connected and undirected). The order and size of  $G$  are  $|V|$  and  $|E|$ , respectively. The distance between two vertices  $u$  and  $v$  in  $G$ , denoted by  $d(u, v)$  is the number of edges in a shortest path (also called a graph geodesic) connecting  $u$  and  $v$ . The diameter of  $G$ , denoted by  $d(G)$ , is the length of the longest graph geodesic in  $G$ . The number of paths of length  $k$  in  $G$  is denoted by  $p_k(G)$  or simply  $p_k$ . The eccentricity of a vertex  $v$  in  $G$  is the maximum distance between  $v$  and any other vertex in  $G$ . A vertex with maximum eccentricity in  $G$  is called a peripheral vertex in  $G$ . The vertices whose eccentricities are equal to the diameter of  $G$  are peripheral vertices of  $G$ . The set of all peripheral vertices of  $G$  is denoted by  $PV(G)$ . The symbol  $\{u, v\}$  denotes an unordered pair of vertices in  $G$ .

The topological indices are graph invariants that play a vital role in chemistry (see [1], [4]-[8], [12], [14]-[17]). They are theoretical molecular descriptors. The Wiener index is an important distance based topological indices defined for graphs, having numerous applications in Chemistry [16]. The Wiener index  $W(G)$  of a graph  $G$  is defined as

$$W(G) = \sum_{\{u,v\} \subset V(G)} d(u, v).$$

The sum of distances between all unordered pairs of peripheral vertices in a graph  $G$  is called the Peripheral Wiener index (see [4], [9]-[11]) of  $G$  and is denoted by  $PW(G)$ :

$$PW(G) = \sum_{\{u,v\} \subset PV(G)} d(u, v).$$

The molecular graph of a chemical compound is a simple connected graph considering atoms of chemical compounds as vertices and the chemical bonds between them as edges. The number of vertices in a molecular graph  $G$  is denoted by  $N(G)$  or simply  $N$ .

QSPR (Quantitative structure-property relationship) studies translates quantitative physical properties of chemical compounds into numerical data which helps to study correlation between properties of chemical compounds, their structure and simultaneously develop regression models. QSPR analysis for many topological indices has been carried out (*cf.* [3]) and the Peripheral Wiener index is one of the recent topological indices (defined in [10]) that is involved in the QSPR study carried out in this paper.

In this paper, by a QSPR analysis for physical properties of lower alkanes involving Peripheral Wiener index, number of paths of length three and the number of vertices in molecular graphs, we present best multiple linear regression models for boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures, critical pressures and surface tensions of lower alkanes.

### 1.1. A QSPR analysis

We carry a correlation and multiple regression analysis for the physical properties-boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures, critical pressures and surface tensions of lower alkanes with Peripheral Wiener index, number of paths of length 3 and the number of vertices in molecular graphs.

Table 1 gives the Peripheral Wiener index  $PW(G)$ , the number of paths  $p_3$  of length three and the number of vertices  $N$  of molecular graphs and the experimental values for the physical properties-Boiling points ( $bp$ )  $^{\circ}C$ , molar volumes ( $mv$ )  $cm^3$ , molar refractions ( $mr$ )  $cm^3$ , heats of vaporization ( $hv$ )  $kJ$ , critical temperatures ( $ct$ )  $^{\circ}C$ , critical pressures ( $cp$ )  $atm$ , and surface tensions ( $st$ )  $dyne\ cm^{-1}$  of considered alkanes. The values given in the columns 4 to 10 in the Table 1 are taken from Seybold et al. [14] and Needham et al. [12] (the same values can be found in [3, 17]).

| Alkane                | $PW$ | $p_3$ | $N$ | $\frac{bp}{^{\circ}C}$ | $\frac{mv}{cm^3}$ | $\frac{mr}{cm^3}$ | $\frac{hv}{kJ}$ | $\frac{ct}{^{\circ}C}$ | $\frac{cp}{atm}$ | $\frac{st}{dyne\ cm^{-1}}$ |

Table 1. Peripheral Wiener Index, Number of paths of length 3 and Number of Vertices of molecular graphs, boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures, critical pressures and surface tensions of low alkanes

## 2. Regression models

Using Table 1, an initial study was carried out with a linear regression model

$$P = A + B(PW(G)),$$

where  $P$  =Physical property and  $PW(G)$ =Peripheral Wiener index and the correlation coefficient  $r$  is computed.

| Physical Properties | $r$          |
|---------------------|--------------|
| $bp$                | 0.197251978  |
| $mv$                | 0.346355015  |
| $mr$                | 0.333426722  |
| $hv$                | 0.142459634  |
| $ct$                | 0.242716244  |
| $cp$                | -0.241588359 |
| $st$                | 0.081503705  |

Table 2. Correlation coefficient  $r$  for the physical properties and the independent variable  $PW$

The correlation coefficients  $r$  obtained in Table 2 for the physical properties were not good enough and we could not establish a satisfactory correlation between the Physical properties and Peripheral Wiener index of graphs of lower alkanes. The next approach involved multiple linear regression models with independent variables  $PW$ ,  $p_3$  and  $N$ .

Using Table 1, the correlation coefficient  $r$  and its square  $r^2$  are computed and tabulated in Table 3 for the physical properties of lower alkanes and the explanatory (independent) variables  $PW$ ,  $p_3$  and  $N$ .

| Physical Properties | $r$         | $r^2$       |
|---------------------|-------------|-------------|
| $bp$                | 0.986832325 | 0.973838037 |
| $mv$                | 0.999275529 | 0.998551584 |
| $mr$                | 0.999951738 | 0.999903477 |
| $hv$                | 0.974026826 | 0.948728258 |
| $ct$                | 0.984031562 | 0.968318114 |
| $cp$                | 0.977580064 | 0.955662782 |
| $st$                | 0.957525168 | 0.916854447 |

Table 3.  $r$  and  $r^2$  for the physical properties and the independent variables  $PW$ ,  $p_3$  and  $N$

We have tested the following linear multiple regression model

$$P = A + B \cdot PW + C \cdot p_3 + D \cdot N,$$

where  $P$  = Physical property and obtained the following models:

$$bp = -90.04704 - 0.410913 \cdot PW + 0.787866 \cdot p_3 + 25.41022 \cdot N \tag{2.1}$$

$$mv = 29.84102 + 0.023342 \cdot PW - 1.67395 \cdot p_3 + 17.77645 \cdot N \tag{2.2}$$

$$mr = 1.633977 + 0.001304 \cdot PW - 0.124821 \cdot p_3 + 4.776364 \cdot N \tag{2.3}$$

$$hv = 1.830816 - 0.102587 \cdot PW - 0.157033 \cdot p_3 + 4.898461 \cdot N \tag{2.4}$$

$$ct = 73.49271 - 0.249444 \cdot PW + 4.387633 \cdot p_3 + 23.64618 \cdot N \tag{2.5}$$

$$cp = 47.86440 + 0.021757 \cdot PW + 0.722312 \cdot p_3 - 3.322539 \cdot N \tag{2.6}$$

$$st = 10.56800 - 0.042930 \cdot PW + 0.375619 \cdot p_3 + 1.029440 \cdot N \tag{2.7}$$

### 3. Conclusion

Table 3, reveals that the linear multiple regression models (2.1)-(2.7) are very useful tools in predicting the physical properties-boiling points, molar volumes, molar refractions, heats of vaporization, critical temperatures, critical pressures and surface tensions of alkanes.

## Acknowledgments

The authors thank the anonymous reviewers for their careful reading of our manuscript and their many insightful comments and suggestions.

**Author Contributions:** All authors equally contributed.

**Conflict of Interest:** The authors declare no conflict of interest.

**Funding (Financial Disclosure):** There is no funding for this work.
